GenAI

project development lifecycle

Adopt and align model

```
[defining the usecase]  →  [choosing the right model]  →  ① Prompt engineering
                                                           ② Fine tuning
                                                           ③ ~~Align~~ Training with human feedback
                                                           ↓ Evaluation
```

[choosing the right model] branches to:
- [foundation models]
- [custom LLM]
- [Evaluation] → Metrics

[foundation models] → Finetuning
① Azure ③ GCP
② AWS

[custom LLM] → Building your own LLM form Scratch

GROQ → LPU

[deployment & application integration]

[optimize and deploy modules for Interfacing] → LLMops
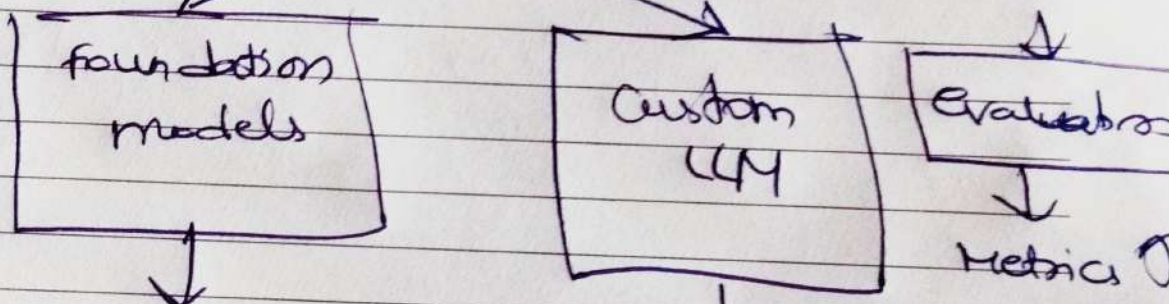

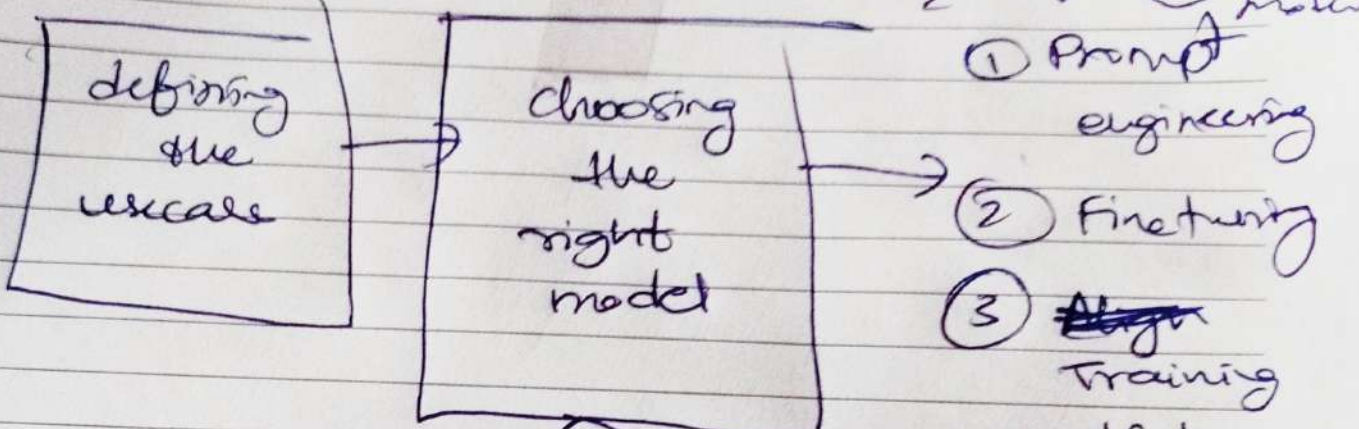

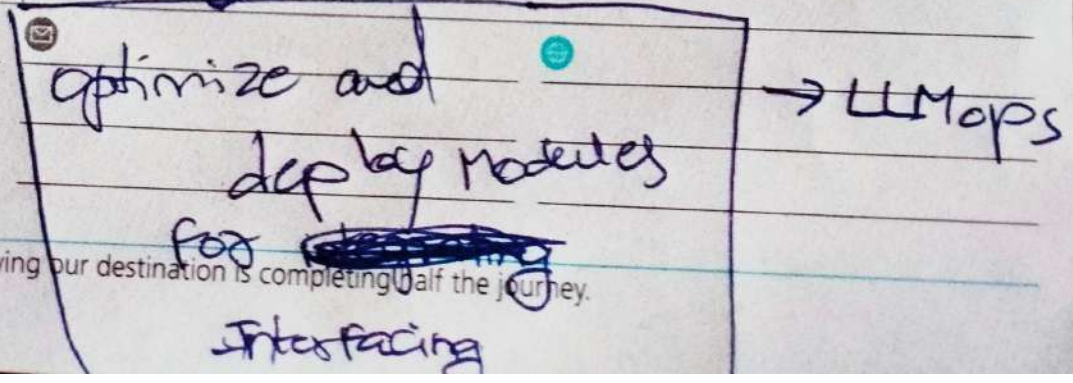

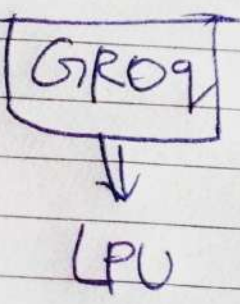

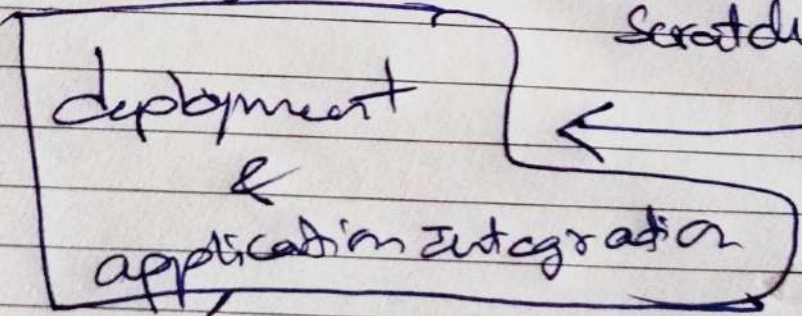

Knowing our destination is completing half the journey.
